

Ernst Sichtermann
Lawrence Berkeley Laboratory

Presently I hold a Division Fellow position at Lawrence Berkeley Laboratory. My research interest is in the nucleon's spin, currently in proton spin structure measurements with the STAR experiment at Brookhaven National Laboratory. This interest dates back to my Ph.D. research with the Spin Muon Collaboration's experiment NA47 at CERN, where I worked and lived for three years.

In 1999 I joined the Muon $g-2$ experiment at the Brookhaven AGS, and lived on-site for about half a year. Since 2003 I have been in STAR at RHIC. I am very interested in the continued study of QCD, in particular the physics program at RHIC and a possible future electron-proton/ion collider.

The future of RHIC and the AGS requires a strong user community. If elected, I hope to support the UEC in its important task to communicate the needs of the user community to the management at Brookhaven National Laboratory and to help convey our exciting research at the Laboratory to the general public and their representatives.
